

On 25 July the radar's new open water lay in farmland; the flooded built-up belt was hidden from it

Western Ahmedabad (Bopal, Ghuma, Shela, Sarkhej). Radar VV before and during the flood, same orbit and geometry; change; and the classified result.

Prepared by Sahasrik Ragani

A · Radar VV, 13 Jul (before)
Sentinel-1D C-SAR IW GRDH · VV gamma0 dB · 2026-07-13 01:09Z · 10 m · S1D_IW_GRDH_1SDV_20260713T010924_20260713T010949_003648_006824_7405

B · Radar VV, 25 Jul 06:39 IST, in light rain

How to read the marks

- OBS**
measured in these pixels; sensor, date and GSD cited
- INF**
what the observations imply; reasoning in the evidence field
- CLAIM**
the object of study, not evidence
- LIMIT**
footprint or positional uncertainty of a measurement

Marks

LIMIT 1 Edge of the radar swath: nothing east of this line was imaged
OBS 2 New open water on 14% of the judgeable ground in this 1 km square; 100% of that water is on cropland (Sentinel-1D C-SAR IW GRDH, 2026-07-25 01:09Z, 10 m)
CLAIM 3 Claimed: Bopal-Ghuma-Shela worst hit, water about 3 ft deep for about 3 days (DeshGujarat 25 Jul 2026 (AMC); Counterview 5 Aug 2026 (opinion column))
INF 4 Built-up brightening falls west to east (+2.1 to +2.6 dB, then +1.6 to +1.8 dB) even where the east flooded: not a flood signal on its own (from: median built-up change within 1.5 km (sar_e1_places.csv); Jodhpur and Vejalpur are worst hit in the press yet brightened least.)

C: VV fell (dark blue) or rose (green) by 4.8 dB or more (Otsu). D, dark blue: new open water (also 25 Jul VV at most -12.8 dB; built-up, trees, permanent water excluded). D, green: built-up that brightened 3 dB or more (chosen; see INF 4).

What these images cannot show

Water between buildings: built-up land (WorldCover 2021) is excluded, so Bopal's streets are not scored. Rain at the pass roughens water and can hide it. Flood water in farmland and paddy flooded for transplanting look alike; 50% was still dark on 6 Aug. The swath misses the river and the east. 10 m pixels miss underpasses.
